Re: **Limited Soil Vapor Investigation (Phase II)**

1412, 1438, 1500 and 1514 Capitola Road  
APNs 026-741-12, 026-741-13, 026-741-14 and 026-741-15  
Unincorporated Census-Designated Place of Live Oak  
Santa Cruz County, California

Dear Ms. Schweickart:

This letter report, prepared by Remediation Risk Management, Inc. (RRM), presents the results of a limited soil vapor investigation (Phase II) performed at the referenced property (Figure 1). This Phase II was conducted subsequent to completion of a Phase I environmental site assessment (ESA) of the property where petroleum hydrocarbons were confirmed to exist on a nearby parcel (Former Live Oak Texaco, 1671 Capitola Road Avenue, Figure 2). Based on the documented cleanup history at the Former Live Oak Texaco, it is possible that contamination from this site may have impacted soil, soil gas, and/or groundwater beneath the property. As a due diligence condition for obtaining project funding for redevelopment of the property, MidPen requested a subsurface investigation to determine if the property has been impacted by migrating contaminants from an offsite source. Summarized below is a description of the property and its background, the scope of work performed, the field and laboratory results, and our conclusions and recommendations. Supporting documentation is attached.

**PROPERTY DESCRIPTION AND BACKGROUND**

The property is comprised of four parcels totaling approximately 3.7 acres, situated along Capitola Road, in the unincorporated, census-designated place of Live Oak, Santa Cruz County, California. The property parcels are assigned assessor's parcel numbers (APNs) 026-741-12 (1412 Capitola Road), 026-741-13 (1438 Capitola Road), 026-741-14 (1500 Capitola Road), and 026-741-15 (1514 Capitola Road). The property is set in a mixed commercial and residential neighborhood. Two small houses occupy the north half of the parcels at 1438 and 1500 Capitola Road; the south half of these parcels and the parcels at 1412 and 1514 Capitola Road are currently vacant and undeveloped. The west and south property boundaries are fenced with wood, chain-link, or wire fencing. Chain link or wire fencing oriented north to south has been constructed along the north half of the three common parcel boundaries separating the four parcels from each other. Wire and chain-link fencing-oriented east to west near the middle of the

parcels at 1438 and 1500 Capitola Road, separates the north half of the parcels from the south half. Bollard and chain barriers have been installed by the current owner along the north parcel boundaries at 1412 and 1514 Capitola Road, to prevent vehicle entry onto the vacant parcels. A site location map is presented as Figure 1, and a site map is presented as Figure 2.

The property was initially developed in or about 1916 as four "ranchettes", or small residential farm parcels. Available evidence suggests farming activities, likely consisting of chicken or flower farming, continued on the property from at least the early 1930's through about 1985. In or about that same year, a road construction company leased or rented the parcel at 1438 Capitola Road for the storage, servicing, and repair of their heavy equipment. The road contractor vacated the property in or about 1994, but their tenancy resulted in minor hydrocarbon impacts to surface soils. These releases were properly addressed to the satisfaction of Santa Cruz County Environmental Health Services staff that same year.

## **SCOPE OF WORK**

### **Soil Vapor Sampling**

Two soil vapor borings, designated VP-1-5 and VP-2-5, were advanced along the east boundary of parcel 026-741-15 (1514 Capitola Road) on December 13, 2019 (Figure 2). A 5/8" diameter rod with expendable tip was used to drive a new sample point to 5 feet below ground surface (bgs); the sample point was connected to 0.17" inner diameter Teflon<sup>®</sup> tubing for sample collection. A hydrated bentonite seal was placed from 3 feet bgs to grade. The well point was tested by applying a vacuum and observing formation pressure to ensure a viable sample could be collected. After waiting two hours for the bentonite grout to properly seal, and for subsurface conditions to equilibrate, RRM staff proceeded to obtain soil vapor samples from the vapor points. A diagram of a typical vapor probe is included in Attachment A.

The sampling procedure entailed connecting sampling manifold to the probe tubing, and stainless-steel Summa<sup>™</sup> canisters (6-liter purge canister and 1-liter sample canister) to the manifold. Samples were collected by drawing soil vapor through the probe, tubing, and into the sample manifold attached to the probe tubing using the vacuum provided in the purge canister. The sample manifold was outfitted with push-to-connect type fittings, valves, and vacuum gauges to monitor and control the flow of soil vapor. The laboratory pre-cleaned Summa<sup>™</sup> canisters were provided at an initial vacuum of approximately 28 inches of mercury.

Helium tracer leak testing was conducted during purging at each location to check for leaks in the above-ground sampling system. Approximately three calculated volumes of gas were purged from the manifold and probe prior to sample collection. Purge volumes were calculated by summing the internal probe and tube volume, annular space around the probe, and manifold tube volume. Purging and sampling were conducted at rates between 100 and 200 milliliters/minute. Helium tracer leak testing was accomplished by placing a plastic shroud over the sample probe location and sampling manifold, and filling the enclosed space with a mixture of helium and air; the mixture was measured in the shroud using a field meter. A diagram of a typical shroud set-up is included in Attachment A.

## RESULTS

### Subsurface Conditions

Groundwater was encountered when advancing boring VP-3-5 (Figure 2) at approximately 23 inches bgs, thus rendering it an unviable sample collection location.

### Laboratory Analysis

**Soil Vapor Laboratory Analyses:** BC Laboratories, a California State-certified laboratory, provided the pre-cleaned Summa™ canisters, and performed all analyses. The soil vapor samples were analyzed for volatile organic compounds (VOCs) using U.S. EPA Modified Method TO-15 and for helium using Modified EPA Method 3C. Analytical results from soil vapor samples are summarized on Table 2, and the laboratory analytical report is included in Attachment A.

Tetrachloroethene (PCE) was detected in samples VP-1-5 and VP-2-5 at concentrations of 8,200 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) and 40,000  $\mu\text{g}/\text{m}^3$ , respectively. Styrene was detected in VP-1-5 and VP-2-5 at an estimated concentration of 180  $\mu\text{g}/\text{m}^3$  and 190  $\mu\text{g}/\text{m}^3$ . Toluene and xylenes were detected in VP-2-5 at 210  $\mu\text{g}/\text{m}^3$  and 240  $\mu\text{g}/\text{m}^3$ , respectively. Toluene was detected in VP-1-5 at an estimated concentration of 240  $\mu\text{g}/\text{m}^3$ , but xylenes were not detected above laboratory limits.

Other analytes detected in VP-1-5 and VP-2-5 included methyl ethyl ketone (estimated concentration of 120  $\mu\text{g}/\text{m}^3$ ) and styrene (estimated 180  $\mu\text{g}/\text{m}^3$  and 190  $\mu\text{g}/\text{m}^3$ ). Other than PCE, no chlorinated solvents were detected in the soil vapor samples.

Helium was detected in VP-2-5 at 620 parts per million by volume (0.062%), indicating the presence of a negligible leak; the results for sample VP-2-5 are considered valid. Helium was not detected in the sample taken from VP-1-5.

### Environmental Screening Levels

The laboratory results were compared to risk characterization environmental screening levels (ESLs) published by the San Francisco Bay Regional Water Quality Control Board<sup>1</sup>. The ESLs selected were for residential land use, where ground water is considered a drinking resource (most conservative scenario), and soil impacts were shallow. The presence of a chemical at concentrations in excess of an ESL does not necessarily indicate adverse effects on human health or the environment, and the presence of a chemical at concentrations below the corresponding ESL can be assumed to not pose a significant threat to human health, water resources, or the environment. The only detected compound exceeding their respective ESL concentration was PCE. The most conservative (residential land use) ESL for PCE is 15  $\mu\text{g}/\text{m}^3$ . Detected compounds and their respective ESLs are shown on Table 1.

---

ESLs, or environmental screening levels, refer to tables of concentrations for specific chemical compounds published in: "Screening For Environmental Concerns At Sites With Contaminated Soil And Groundwater", by the Regional Water Quality Control Board, San Francisco Bay region. ESLs consist of tabulated guidance criteria for comparing site-specific concentrations of common environmental contaminants in soil, groundwater, soil gas, and indoor air, to those determined to generally have no unacceptable exposure risk. They have been updated or revised several times since they were initially issued in 2001; most recently in January 2019.

## CONCLUSIONS AND RECOMMENDATIONS

From the findings of this investigation, RRM concludes the following:

- PCE was detected in soil gas samples collected from borings VP-1-5 and VP-2-5 at concentrations of 8,200  $\mu\text{g}/\text{m}^3$  and 40,000  $\mu\text{g}/\text{m}^3$ , respectively.
- Methyl ethyl ketone, styrene, toluene, and xylenes were also detected in soil gas samples collected from both borings; concentrations of these compounds did not exceed their respective ESLs for the most conservative land use scenario.
- PCE has previously been detected in a sample of groundwater collected from a monitoring well formerly located on the adjacent parcel to the east of the property, approximately 200 feet from the east border of the 1514 Capitola Road parcel. The monitoring well was installed during the environmental investigation phase of the former Live Oak Service (Texaco) at 1671 Capitola Road. PCE was detected in groundwater from the most recent sample at 55 parts per billion (or micrograms per liter), in 2012.

Based on the foregoing conclusions, RRM recommends confirmation soil gas samples be collected in the same locations or near to VP-1-5 and VP-2-5. RRM also recommends collecting grab-groundwater samples in order to evaluate the condition of groundwater beneath the property. Passive soil gas samplers<sup>2</sup> may also be used to more cost-effectively survey the lateral extent of the subsurface PCE and other compounds, and to gain insight into their relative magnitudes in various locations.

Should you have any questions regarding the contents of this document, please do not hesitate to call RRM at (831) 475-8141.

Sincerely,  
**RRM, Inc.**

---

<sup>2</sup> Passive soil gas samplers involve placement of a sorbent device at the sample collection location, typically a shallow hand-drilled, narrow-gauge borehole, for a set period of time, typically one to two weeks. Upon recovery, the mass of individual chemical species adsorbed onto the sorbent is analytically determined and reported. The devices are useful survey tools; however, the data they yield, mass per time, is not currently accepted by most regulatory agencies for the purpose of vapor plume characterization. Nonetheless, they can be beneficial to focus the later efforts that may involve the installation of more expensive permanent monitoring features such as permanent vapor sampling probes or groundwater monitoring wells.

**LABORATORY REPORT**

January 8, 2020

Molly Meyers  
BC Laboratories, Inc.  
4100 Atlas Court  
Bakersfield, CA 93308

**RE: 1942419**

Dear Molly:

Enclosed are the results of the samples submitted to our laboratory on December 5, 2019. For your reference, these analyses have been assigned our service request number P2000011.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at [www.alsglobal.com](http://www.alsglobal.com). Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

**ALS | Environmental**

Client: BC Laboratories, Inc.  
Project: 1942419

Service Request No: P2000011

**CASE NARRATIVE**

The samples were received intact under chain of custody on December 5, 2019 and were stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Helium Analysis

The samples were analyzed for helium according to modified EPA Method 3C (single injection) using a gas chromatograph equipped with a thermal conductivity detector (TCD). This method is not included on the laboratory's NELAP or DoD-ELAP scope of accreditation.

*The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.*

*Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.*

ALS Environmental Sample Acceptance Check Form

Client: BC Laboratories, Inc. Work order: P2000011
Project: 192419
Sample(s) received on: 1/2/20 Date opened: 1/2/20 by: DENISE.POSADA

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity.

- 1 Were sample containers properly marked with client sample ID?
2 Did sample containers arrive in good condition?
3 Were chain-of-custody papers used and filled out?
4 Did sample container labels and/or tags agree with custody papers?
5 Was sample volume received adequate for analysis?
6 Are samples within specified holding times?
7 Was proper temperature (thermal preservation) of cooler at receipt adhered to?
8 Were custody seals on outside of cooler/Box/Container?
9 Do containers have appropriate preservation, according to method/SOP or Client specified information?
10 Tubes: Are the tubes capped and intact?
11 Badges: Are the badges properly capped and intact?

Table with 7 columns: Lab Sample ID, Container Description, Required pH, Received pH, Adjusted pH, VOA Headspace (Presence/Absence), Receipt / Preservation Comments. Contains two rows of data for Client Canister samples.

Explain any discrepancies: (include lab sample ID numbers):

RSK - MEPPP, HCL (pH<2); RSK - CO2, (pH 5-8); Sulfur (pH>4)
