### Re: Limited Soil Vapor Investigation (Phase II)

1412, 1438, 1500 and 1514 Capitola Road APNs 026-741-12, 026-741-13, 026-741-14 and 026-741-15 Unincorporated Census-Designated Place of Live Oak Santa Cruz County, California

Dear Ms. Schweickart:

This letter report, prepared by Remediation Risk Management, Inc. (RRM), presents the results of a limited soil vapor investigation (Phase II) performed at the referenced property (Figure 1). This Phase II was conducted subsequent to completion of a Phase I environmental site assessment (ESA) of the property where petroleum hydrocarbons were confirmed to exist on a nearby parcel (Former Live Oak Texaco, 1671 Capitola Road Avenue, Figure 2). Based on the documented cleanup history at the Former Live Oak Texaco, it is possible that contamination from this site may have impacted soil, soil gas, and/or groundwater beneath the property. As a due diligence condition for obtaining project funding for redevelopment of the property, MidPen requested a subsurface investigation to determine if the property has been impacted by migrating contaminants from an offsite source. Summarized below a description of the property and its background, the scope of work performed, the field and laboratory results, and our conclusions and recommendations. Supporting documentation is attached.

## PROPERTY DESCRIPTION AND BACKGROUND

The Property is comprised of four parcels totaling approximately 3.7 acres, situated along Capitola Road, in the unincorporated, census-designated place of Live Oak, Santa Cruz County, California. The Property parcels are assigned assessor's parcel numbers (APNs) 026-741-12 (1412 Capitola Road), 026-741-13 (1438 Capitola Road), 026-741-14 (1500 Capitola Road), and 026-741-15 (1514 Capitola Road). The Property is set in a mixed commercial and residential neighborhood. Two small houses occupy the north half of the parcels at 1438 and 1500 Capitola Road; the south half of these parcels and the parcels at 1412 and 1514 Capitola Road are currently vacant and undeveloped. The west and south Property boundaries are fenced with wood, chain-link, or wire fencing. Chain link or wire fencing oriented north to south has been constructed along the north half of the three common parcel boundaries separating the four parcels from each other. Wire and chain-link fencing-oriented east to west near the middle of the

parcels at 1438 and 1500 Capitola Road, separates the north half of the parcels from the south half. Bollard and chain barriers have been installed by the current owner along the north parcel boundaries at 1412 and 1514 Capitola Road, to prevent vehicle entry onto the vacant parcels. A site location map is presented as Figure 1, and a site map is presented as Figure 2.

The property was initially developed in or about 1916 as four "ranchettes", or small residential farm parcels. Available evidence suggests farming activities, likely consisting of chicken or flower farming, continued on the Property from at least the early 1930's through about 1985. In or about that same year, a road construction company leased or rented the parcel at 1438 Capitola Road for the storage, servicing, and repair of their heavy equipment. The coat contractor vacated the property in or about 1994, but their tenancy resulted in minor hydrocarbon impacts to surface soils. These we properly addressed to the satisfaction of Santa Cruz County Environmental Health Services staff that same year.

#### SCOPE OF WORK

### **Soil Vapor Sampling**

Two soil vapor borings, designated VP-1-5 and VP-2-5, were advanced along the east boundary of parcel 026-741-15 (1514 Capitola Road) on December 13, 2019 (Figure 2). A 5/8" diameter rod with expendable tip was used to drive a new sample point to 5 feet below ground surface (bgs); the sample point was connected to 0.17" inner diameter Teflon<sup>®</sup> tubing for sample collection. A hydrated bentonite seal was placed from 3 feet b some grade. The well point was tested by applying a vacuum and observing formation pressure to ensure a viable sample could be collected. After waiting two hours for the bentonite grout to properly seal, and for subsurface conditions to equilibrate, RRM staff proceeded to obtain soil vapor samples from the vapor points.

The sampling procedure entailed connecting sampling manifold to the probe tubing, and stainless-steel Summa<sup>™</sup> canisters (6-liter purge canister and 1-liter sample canister) to the manifold. Samples were collected by drawing soil vapor through the probe, tubing, and into the sample manifold attached to the probe tubing using the vacuum provided in the purge canister. The sample manifold was outfitted with push-to-connect type fittings, valves, and vacuum gauges to monitor and control the flow of soil vapor. The laboratory pre-cleaned Summa<sup>™</sup> canisters were provided at an initial vacuum of approximately 28 inches of mercury.

Helium tracer leak testing was conducted during purging at each location to check for leaks in the aboveground sampling system. Approximately three calculated volumes of gas were purged from the manifold and probe prior to sample collection. Purge volumes were calculated by summing the internal probe and tube volume, annular space around the probe, and manifold tube volume. Purging and sampling were conducted at rates between 100 and 200 milliliters/minute. Helium tracer leak testing was accomplished by placing a plastic shroud over the sample probe location and sampling manifold, and filling the enclosed space with a mixture of helium and air; the mixture was measured in the shroud using a field meter. A diagram of a typical shroud set-up is included in Attachment A.

### RESULTS

#### **Subsurface Conditions**

Groundwater was encountered when advancing boring VP-3-5 (Figure 2) at approximately 23 inches bgs, thus rendering it an unviable sample collection location.

### Laboratory Analysis

<u>Soil Vapor Laboratory Analyses</u>: BC Laboratories, a California State-certified laboratory, provided the precleaned Summa<sup>™</sup> canisters, and performed all analyses. The soil vapor samples were analyzed for volatile organic compounds (VOCs) using U.S. EPA Modified Method TO-15 and for helium using Modified EPA Method 3C. Analytical results from soil vapor samples are summarized on Table 2, and the laboratory analytical report is included in Attachment A.

Tetrachloroethene (PCE) was detected in samples VP-1-5 and VP-2-5 at concentrations of 8,200 micrograms per cubic meter ( $\mu$ g/m<sup>3</sup>) and 40,000  $\mu$ g/m<sup>3</sup>, respectively. Styrene was detected in SV-1-5 and SV-2-5 at an estimated concentration of 180  $\mu$ g/m<sup>3</sup> and 190  $\mu$ g/m<sup>3</sup>. Toluene and xylenes were detected in SV-2-5 at 210  $\mu$ g/m<sup>3</sup> and 240  $\mu$ g/m<sup>3</sup>, respectively. Toluene was detected in SV-1-5 at an estimated concentration of 240  $\mu$ g/m<sup>3</sup>, but Xylenes were not detected above laboratory limits.

Other analytes detected in VP-1-5 and VP-2-5 included methyl ethyl ketone (estimated concentration of 120  $\mu$ g/m<sup>3</sup>) and styrene (estimated 180  $\mu$ g/m<sup>3</sup> and 190  $\mu$ g/m<sup>3</sup>)

Helium was detected in VP-2-5 at 620 parts per million by volume (0.062%), indicating the presence of a negligible leak; the results for sample VP-2-5 are considered valid. Helium was not detected in the sample taken from VP-1-5.

#### **Environmental Screening Levels**

The laboratory results were compared to risk characterization environmental screening levels (ESLs) published by the San Francisco Bay Regional Water Quality Control Board<sup>1</sup>. The ESLs selected were for residential land use, where ground water is considered a drinking resource (most conservative scenario), and soil impacts were shallow. The presence of a chemical at concentrations in excess of an ESL does not necessarily indicate adverse effects on human health or the environment, and the presence of a chemical at concentrations below the corresponding ESL can be assumed to not pose a significant threat to human health, water resources, or the environment. The only detected compound exceeding their respective ESL concentration was PCE. The most conservative (residential land use) ESL for PCE is  $15 \,\mu$ g/m<sup>3</sup>. Detected compounds and their respective ESLs are shown on Table 1.

ESLs or environmental screening levels, refer to contaminate levels for specific compounds published in: "*Screening For Environmental Concerns At Sites With Contaminated Soil And Groundwater*", by the Regional Water Quality Control Board, San Francisco Bay region, February 2005, updated November 2007, revised May 2008, and most recently, Januar 2019.

#### CONCLUSIONS AND RECOMMENDATIONS

From the findings of this investigation, RRM concludes the following:

- PCE was detected in soil gas samples collected from borings VP-1-5 and VP-2-5 at concentrations of 8,200 μg/m<sup>3</sup> and 40,000 μg/m<sup>3</sup>, respectively.
- Methyl ethyl ketone, styrene, toluene, and xylenes were also detected in soil gas samples collected from both borings; concentrations of these compounds did not exceed their respective ESLs for the most conservative land use scenario.
- PCE has previously been detected in a sample of groundwater collected from a monitoring well formerly located on the adjacent parcel to the east of the property, approximately 200 feet from the east border of the 1514 Capitola Road parcel. The monitoring well was installed during the environmental investigation phase of the former Live Oak Service (Texaco) at 1671 Capitola Road. PCE was detected in groundwater from the most recent sample at 55 parts per billion (or micrograms per liter), in 2012.

Based on the foregoing conclusions, RRM recommends confirmation soil gas samples be collected in the same locations or near to VP-1-5 and VP-2-5. RRM also recommends collecting grab-groundwater samples in order to evaluate the condition of groundwater beneath the property, and to determine whether the PCE plume emanating from the former Texaco site has migrated onto the property.

Should you have any questions regarding the contents of this document, please do not hesitate to call RRM at (831) 475-8141.

Sincerely, RRM, Inc.

Steven Clark Senior Geologist CHG 167 Cate Townsend Project Geologist

	LABORATORY REPORT
January 8, 2020	
Molly Meyers BC Laboratories, Inc. 4100 Atlas Court Bakersfield, CA 93308	
RE: 1942419	
Dear Molly:	
	nples submitted to our laboratory on December 5, 2019. Fo been assigned our service request number P2000011.
assurance program. The test res standards, where applicable, and ex specific list of NELAP and DoD-EL	ding to our laboratory's NELAP and DoD-ELAP-approved quali ults meet requirements of the current NELAP and DoD-ELA xcept as noted in the laboratory case narrative provided. For AP-accredited analytes, refer to the certifications section a tended to be considered in their entirety and apply only to the ein.
If you have any questions, please ca	all me at (805) 526-7161.
Respectfully submitted,	
ALS   Environmental	
Sne Orderta
